

Healthy hooves by preventive group application

- ◆ Supports the prevention against clawinfections
- ◆ The alternative for formalin and copper sulphate
- ◆ Also effective with low temperatures
- ◆ Safe for user and animals

Care

Exolium® Hoofcare

Exolium Hoofcare products were developed by Kanters to support your animals' claw health. Thanks to their specific composition, Exolium products are widely applicable and very suitable to care for your animals' claws. This makes them extremely suitable for both individual or herd treatment. Of course, a combination of both is also possible. In addition to their broad applicability, all products are free of antibiotics, formalin and copper sulphate. As a result, there is no risk of antibiotic resistance and the products are safe for animals, users and the environment. Exolium Hoofcare products meet all requirements and are therefore, among other things, extremely suitable to contribute to your business operations.

What is Exolium® Hoofmix?

Exolium Hoofmix is based on copper chelates and detergents for preventive group application. Exolium Hoofmix has a very strong adhesion for optimal effect and protection.

Copper

- ◆ Antibacterial
- ◆ Supports solid claws

Detergents

- ◆ Cleaning claw

Chelates

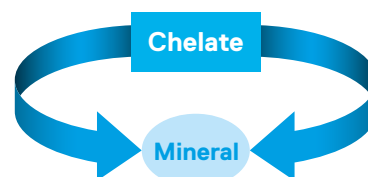

- ◆ Dirt resistant
- ◆ Penetrate deep into skin
- ◆ Effective at any temperature
- ◆ No formation of resistance

What are the advantages?

- ◆ Supports prevention against claw infections
- ◆ The alternative for formalin and copper sulfate
- ◆ Also effective with low temperatures
- ◆ No chance of inhalation and dust-free

Mode of action

Exolium Hoofmix has been developed for use in the foot bath. The combination of copper chelates, organic acids and detergents ensures optimal claw care and effective adhesion, which prevents skin irritations. Furthermore, Exolium Hoofmix is very concentrated, so a pH drop in the foot bath is quickly realized. This allows more animals to be treated with a low dose.

Chelates protect the mineral.

Application Exolium® Hoofmix

The recommended dose is 3%. Depending on the infection pressure, the dose can vary between 2% and 5%. For optimal effect, it is recommended to clean the claws of your animals with water to increase the effectiveness of the treatment. In addition, it is important that the bath has a minimum volume of 150 liters and that there is a minimum volume of 1 liter of bath water per animal. If your bath does not meet these conditions, the water must be changed on time. Exolium Hoofmix is part of the Exolium prevention protocol. Depending on the infection pressure, treatment should be repeated every 1 to 2 weeks (2 consecutive days). Existing infections should always be treated with Exolium Hoofgel or Exolium® Hoofclear for optimal effect. If the Exolium prevention protocol is not followed, it is recommended to repeat the treatment weekly.
